

## Assignment A10a – Design:

Our goal is to create a fun party-game style activity for our users to enjoy, either against themselves, or head-to-head with a friend. Specifically we are designing software implementation of the popular word game “Boggle”.

Our application will:

- Provide a GUI for one or two players to play Boggle
- The internal logic necessary for generating a valid board with reasonable letter-distribution
- Score user entries
- Offer a leader-board and game tracker persistent across instances of our application

GameBoard
-Dice[][]: char -letters[][]: char isFinished: Boolean
+GameBoard(Player: String) +GameBoard(Player1: String, Player2: String) -isAdjacent(row1: int, col1: int, row2: int, col2: int) : boolean -guess(player: player, row: int, col: int) -resetGame() +getBoard : GameBoard

Player
+name: String -score: int -gamesWon: int -gamesPLayed: int -wordsFound: String[]
+Player(name:String) -changeName(newname:String)

Judge
-winner: String -scores[]: int[] -leaderBoard: Player[]
+displayStats +displayScore(player1: player) : int +displayScore(player1: player, player2: player) : int[]

Sample Output

Boggle!
